"You have a what, inside you?"

Less than mainstream medical devices encountered in the ED.

Eric Ossmann, MD, FACEP
Associate Professor
Duke University Medical Center
Objectives

- Review short, medium and long term vascular access devices
- Understand common complications associated with vascular access devices
- Understand how to appropriately utilize a vascular access device in an emergency
- Review the function of Pacemakers and AICD devices
- Understand common complications associated with pacemakers and AICD devices
Deciphering Medical Devices

- What does it do?
  - Basic description
  - Typical use
  - Basic description of function

- What does it look like?

- What can go wrong?

- How do I fix it?
Vascular Access Devices

Short Term
- Peripheral IV
- Percutaneous Multilumen Central Catheters

Medium Term
- Midline Catheters
- PICC Lines

Long Term
- Tunneled RA Catheters
- Implantable Ports
Percutaneous Multilumen Central Catheters

- **Short Term Use (< week)**
  - IV medications
  - Blood products
  - CVP monitoring
  - Hyperalimentation

- **Description**
  - Silicone or polyurethane
  - Over the wire insertion
  - 1 to 5 lumens
  - 15 to 30 cm in length

- **Complications**
  - Overall = 3.5%
  - Pulmonary
  - Vascular/Bleeding
  - Infectious
  - Neurologic
Percutaneous Multilumen Central Catheters

- **Emergency Access**
  - Swab catheter/cap junction with povidone-iodine
  - Clamp catheter
  - Replace cap if needed using aseptic technique
  - Attach 10 cc syringe with saline flush
  - Open clamp
  - Aspirate 5 cc and discard then flush with 5 cc of normal saline
  - Administer medication
  - Flush with 5 cc of normal saline after every use
  - After use heparin flush if available
  - Close clamp
  - Notify ED staff that catheter was accessed and type of flush used

### Double Lumen

<table>
<thead>
<tr>

Percutaneous Multilumen Central Catheters

- **Catheter Dislodgement**
  - Stop on-going infusions
  - Clamp all lumens
  - Do not remove catheter if still in place
  - Cover insertion site with sterile gauze
  - Apply direct pressure at site for 10 minutes if bleeding
  - Transport to ED

- **Catheter Sheared / Cut**
  - Apply clamp proximal to the cut
  - Cover insertion site with sterile gauze
  - Apply direct pressure at site for 10 minutes if bleeding
  - Transport to ED

- **Infection at Catheter Site**
  - Do not use catheter unless life threat is present
  - Do not remove catheter
  - Provide supportive care
  - Transport to ED
Midline IV Catheters

- **Medium Term (2 to 4 weeks)**
  - Limited IV medications
  - Not used for:
    - Chemotherapy
    - Hyperalimentation
    - High osmolality medications

- **Description**
  - Silicone or polyurethane
  - Open tip or Groshong
  - Introduced with a stylet via introducer sheath
  - Tip rests in proximal arm veins
  - 1 to 2 lumens
  - 20 cm in length

- **Complications**
  - Vascular/Bleeding
  - Infectious
Peripherally Inserted Central Catheters (PICC Lines)

- Medium Term (2 to 4 weeks)
  - IV medications
  - Chemotherapy
  - Hyperalimentation

- Description
  - Silicone or polyurethane
  - Open tip or Groshong
  - Introduced via guide wire
  - Tip rests in SVC
  - 1 to 3 lumens
  - 50 to 60 cm in length

- Complications
  - Vascular/Bleeding
  - Infectious
Midline IV Catheters & PICC Lines

© Emergency Access

- Swab catheter/cap junction with povidone-iodine
- Clamp catheter (open tip only)
- Replace cap if needed using aseptic technique
- Attach 10 cc syringe with saline flush
- Open clamp (if present)
- Aspirate 5 cc and discard then flush with 5 cc of normal saline
- Administer medication
- Flush with 5 cc of normal saline after every use
- After use flush with 10 cc normal saline
- Close clamp
- Notify ED staff that catheter was accessed and type of flush used
Groshong Tip Catheters

- No clamping
- No Heparin
- Use 10 cc syringe and normal saline flush
- Aspirate & flush 20 cc of normal saline
Tunneled Central Venous Catheters

- **Broviac**
  - single lumen
  - 1.0 mm ID
- **Hickman**
- **Hemocath/Permacath**
  - 2 lumen
  - 2.2 mm ID
  - 1 or 2 lumen
  - 1.6 mm ID
Tunneled Central Venous Catheters

- **Long Term (1 year)**
  - IV medications
  - Blood products
  - Chemotherapy
  - Dialysis
  - Hyperalimentation

- **Description**
  - Silicone
  - Over the wire insertion
  - 1 to 3 lumens
  - Open ended or Groshong

- **Complications**
  - Pulmonary
  - Vascular/Bleeding
  - Infectious
  - Neurologic
Tunneled Central Venous Catheters

Emergency Access

- Swab catheter/cap junction with povidone-iodine
- Clamp catheter
- Replace cap if needed using aseptic technique
- Attach 10 cc syringe
- Open clamp
- Aspirate 5 cc and discard then flush with 5 cc of normal saline
- Administer medication
- Flush with 5 cc of normal saline after every use
- After use heparin flush if available
- Notify ED staff that catheter was accessed and type of flush used
Implantable Vascular Access Devices

- Long Term (1 year)
  - IV medications
  - Blood products
  - Chemotherapy
  - Dialysis
  - Hyperalimentation

- Description
  - Silicone catheter
  - Port
  - 1 to 2 lumens
  - Open ended or Groshong

- Complications
  - Pulmonary
  - Vascular/Bleeding
  - Infectious
  - Neurologic
Implantable Vascular Access Devices

- **Emergency Access**
  - Clean skin with providone-iodine solution
  - Attach 19 or 22 gauge Huber (non-coring) needle to extension tube with clamp and 10 cc syringe
  - Access port at 90 degree angle
  - Open clamp
  - Aspirate 5 cc and discard then flush with 5 cc of normal saline
  - Apply antibiotic ointment to puncture site and stabilize Huber needle with gauze dressing
  - Administer medication
  - Flush with 5 cc of normal saline after every use
  - After use heparin flush if available
  - Notify ED staff that catheter was accessed and type of flush used
## Flushing Vascular Access Devices

<table>
<thead>
<tr>
<th>Device Type</th>

<th>After Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>Percutaneous Multilumen CVC</td>
<td>5 cc saline</td>
<td>5 cc heparin (100 U/ml)</td>
</tr>
<tr>
<td>Midline or PICC</td>
<td>5 cc saline</td>
<td>10 cc saline</td>
</tr>
<tr>
<td>Tunneled CVC</td>
<td>5 cc saline</td>
<td>5 cc heparin (100 U/ml)</td>
</tr>
<tr>
<td>Groshong Catheters</td>
<td>5 cc saline</td>
<td>10 cc saline</td>
</tr>
<tr>
<td>Implantable Venous Access Devices</td>
<td>10 cc saline</td>
<td>5 cc heparin (100 U/ml)</td>
</tr>
</tbody>
</table>

- Always use a 10 cc syringe to flush
- Flush gently
- Notify ED staff immediately of VAD use, type and quantity of flush
Cardiac Pacemakers

- **Function**
  - Provide an electrical stimulus to initiate mechanical contraction

- **Description**
  - Implanted in the chest wall
  - Weigh < 30 gm
  - Components
    - Pulse Generator
    - Battery
    - Leads
  - Life span = 4 to 10 years
  - Leads may go to the atrium, ventricle or both chambers
  - Rate is usually set between 60 and 80 beats per minute

- **R** - Rate Modulation
Normal VVI Pacemaker

- Pacemaker is set at 75 beats/min
- Pacemaker spike precedes QRS
- Note intrinsic QRS complexes
Normal DDD Pacemaker

- Note each QRS is preceded by 2 pacer spikes
- Pacing of the RV produces QRS with left bundle branch morphology
Pacemaker Complications

- Failure to Pace
- Failure to Sense
- Failure to Capture
- Inappropriate Pacemaker Rate
- Other
Failure to Pace

- No pacemaker spikes despite an intrinsic rate below threshold

Common Causes
- Lead disconnection or fracture
- Battery depletion
- Component failure
- Oversensing

Chest radiograph of a 68-year-old male after a DDD pacemaker is placed for complete heart block.
Magnet Use to Evaluate Failure to Pace

- Magnet is used to turn on asynchronous mode
- Ring magnet triggers reed switch
- May also use magnet to reset runaway pacer
A 68-year-old male with ventricular pacing after placement of a DDD pacemaker. Note the pacer spacer spikes that precede the wide QRS complex. The pacing spikes are best seen in leads V3-V6.
The same patient as in Figure 1 with a DDD pacer after magnet application, which disables the sensing function. The ventricular rate has increased by 10 beats per minute when compared to ECG without magnet. Atrial pacing also is noted. The pacing spikes are best seen in leads V3-V6.
Failure to Sense

- Constant pacemaker spikes despite intrinsic cardiac activity

Common Causes
- Lead dislodgement or fracture
- Fibrosis at the lead tip
- Battery depletion
- External interference
- Low amplitude cardiac signal
Failure to Capture

• Appropriate pacemaker spikes without subsequent cardiac activity

• Common Causes
  • Lead dislodgement or fracture
  • Fibrosis at the lead tip
  • Battery depletion
  • Metabolic abnormalities
  • Antiarrhythmic medications
Inappropriate Pacemaker Rate

- Extremely rare event with modern devices
- Usually in DDD type pacers
- Endless loop reentry tachycardia

Other Complications

- Infections
  - 1 to 15%
  - S. aureus
- Cardiac perforation
- Pericarditis
- Vessel injury
- Venous thrombosis
Automatic Implanta ble Cardiac Defibrillator

- **Function**
  - Automatic defibrillation of malignant ventricular arrhythmias

- **Description**
  - Implanted in the chest wall
  - Weigh 60-70 gm
  - Components
    - Pulse Generator
    - Battery
    - Leads
  - Life span = 4 to 10 years
  - Leads go to the ventricle and in some cases also the atrium
AICD Complication

- Inappropriate Shock
  - 35%
  - Misinterpretation
- Pacemaker Interference
- Lead Dislodgement / fracture
- Infection
- Inadvertent Inactivation
AICD Skin Erosion

- Site Infection
- Pressure Necrosis
